

Down to the Wire with Allied Gator's new solution

Uniquely suited to handle hardened steel wire, all types of steel cable and rebar, the patented Allied-Gator MT Series Multi-Tool fitted with the patented quick-change shear jaw set is the only shear design that has proven itself to stand up to continual use in these full-time processing applications. These materials have been notoriously troublesome for recy-

clers, and have traditionally been very costly to process with mobile shears. However, the Allied-Gator MT offers the profitable solution.

The MT's power and rigid jaw design are just two of the key attributes that allow cutting these materials on a long-term basis to be profitable. The MT's unrivalled throat force, generated by the patented Allied-Gator

power-link and guide system, enables the tool to power through each cut with a continual power gain, rather than lose force after these materials have massed themselves into the shear jaw.

In addition, the superior strength and rigidity of the MT's high-alloy steel components allow the tool to shear through these

wire, cable and rebar materials while providing the shear blades the stability they require. This enables the shear jaw set to maintain the blade clearances that are essential to continual cutting performance in these specialized applications. See the link www.alliedgator.com/videos.
